

### New portal powered by Microsoft® Office SharePoint Server enables a cultural organization to spread its message to the world

Many people learn about different parts of the world through the Internet. With more than a billion people online nowadays, there is no better place to promote a country's unique culture and tradition via its own web portal. Our client was looking to build a new Content Management System (CMS) for its web portal. With extensive experience in content management and Microsoft® SharePoint technology, Founder delivered a SharePoint-based CMS that allows our client to manage its online resources more efficiently and effectively while promoting its messages to a larger number of audiences.

#### Client Overview

The client is a public service entity. One of its objectives is to promote Spanish culture through its web portal. The client's existing website was built long ago with outdated technologies. The client found that their online resources such as documents, images and video files were poorly organized and difficult to maintain. The client was looking to create a new web portal based on the latest technologies that would provide better extensibility and maintainability. The client came to us due to our extensive experience in CMS development and Microsoft® Office SharePoint Server 2007 (MOSS) technologies.

#### Solution Highlights

Working with our Spanish partner, the Founder team implemented a CMS solution based on Microsoft® SharePoint Server 2007. Throughout the development cycle, Founder helped the client to identify and to migrate all existing resources to the new system. The new system allows the client to centrally manage all of its resources such as images, videos, online-catalogs, audios and documents. Solution highlights include:

- ▣ Role-based access authorization
- ▣ Centralized resource management
- ▣ Clearly defined workflow for content publication
- ▣ RSS news feeds
- ▣ Newsletter distribution
- ▣ Multiple-Language support (5 different languages)
- ▣ Web Accessibility Initiative (WAI) Compliance for people with disabilities

#### Benefits

The client is now able to manage its online resources more efficiently and effectively. With publication workflow and role-based access authorization enabled, more people can now contribute contents to the portal. Features such as newsletter and RSS news feeds help client to reach out to a larger number of audiences who are interested in Spanish culture.

#### Project Snapshot

##### Industry

- Government

##### Client Location

- Madrid, Spain

##### Services

- Customized Application Development

##### Implementation Details

- Offshore development
- 6 months development
- Team of 10

##### Technologies

- Microsoft SharePoint Server 2007
- .NET Framework
- SQL Server

#### Founder's Success Factors

- Founder's proven capability in utilizing and successfully delivering solutions based on Microsoft® SharePoint technology
- Early awareness of the importance of data migration planning
- Regular requirement validations through remote access to development/staging environments
